

Generative AI is changing how people learn, work, and create, so here is a short speech you can use:

“Good morning everyone. Today, generative AI is no longer just a buzzword; it is a technology that can create text, images, code, music, and even videos from simple prompts, opening a new era of human–computer collaboration. By learning patterns from massive amounts of data, these models can help us draft emails, design products, prototype software, and personalize learning at a scale that was impossible a few years ago.aws.amazon+2

But with this power comes responsibility. Generative AI can also spread misinformation, amplify bias, and raise serious questions around privacy, fairness, and intellectual property if used carelessly. Our role is not to fear this technology, but to guide it: to ask better questions, verify its outputs, protect our data, and use it to augment human creativity rather than replace it. If we stay curious, ethical, and hands-on, generative AI can become a tool that helps us build smarter solutions, more inclusive products, and a future where technology truly serves people. Thank you.”nnlm+4
